SURF

LFM 2024

LOFAR Dutch (~6")

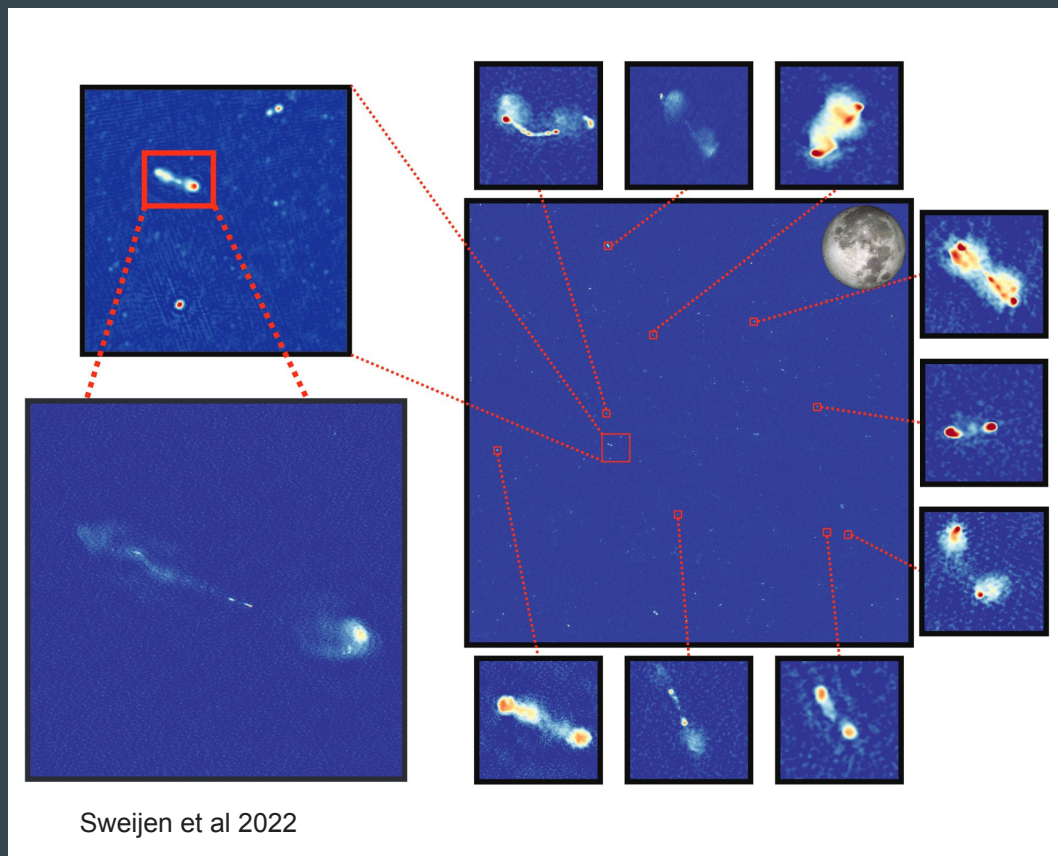

LOFAR International (~0.3")

Lockman Hole 0.3" with 8 hours data

- ★ 2.5 x 2.5 degrees
- ★ ~8 billion pixels
- ★ ~2500 sources
- ★ ~30 $\mu\text{Jy}/\text{beam}$

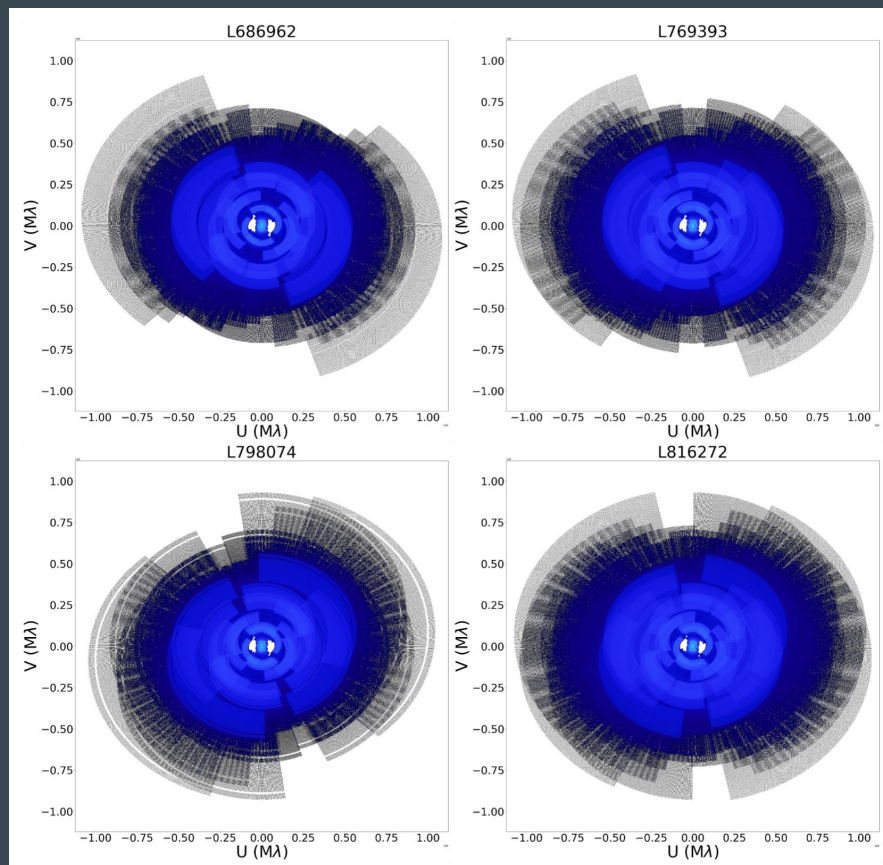

ELAIS-N1 with 32 hours

★ 4 observations

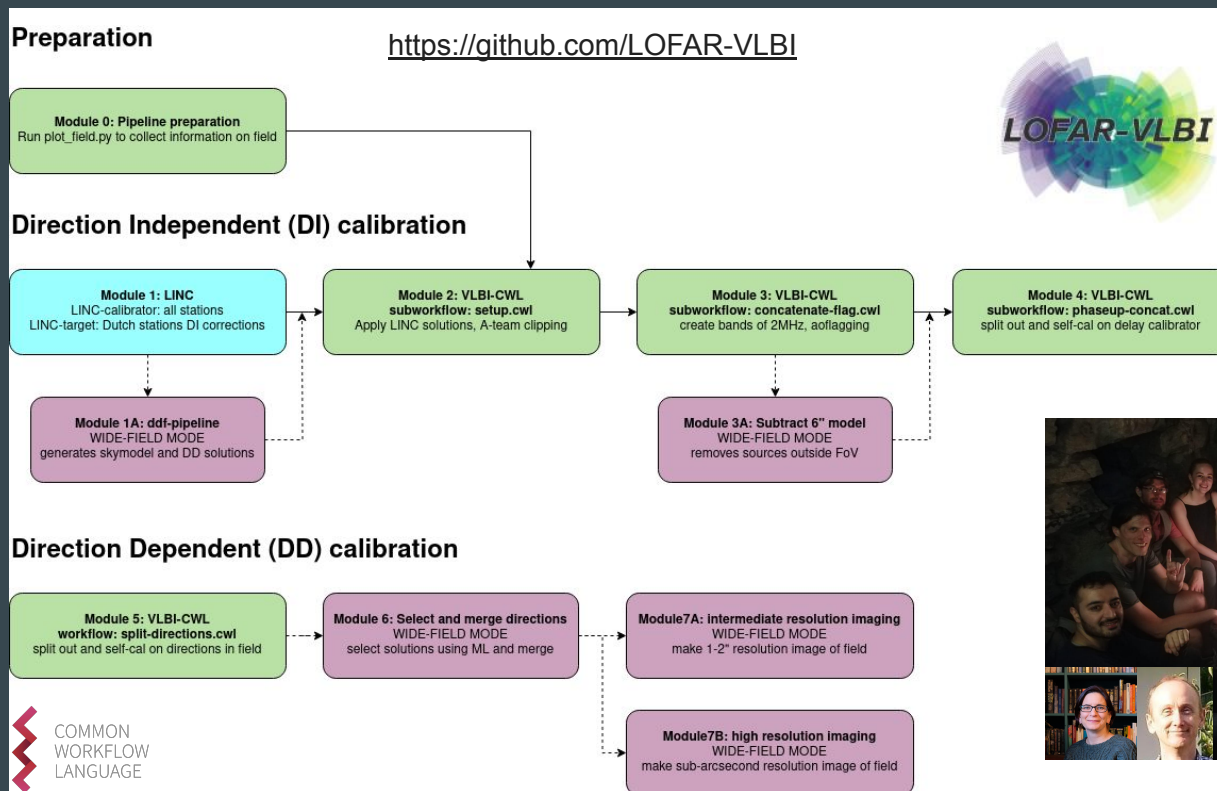

- 26-11-2018
- 24-05-2020
- 14-11-2020
- 13-5-2021

★ 2 times deeper

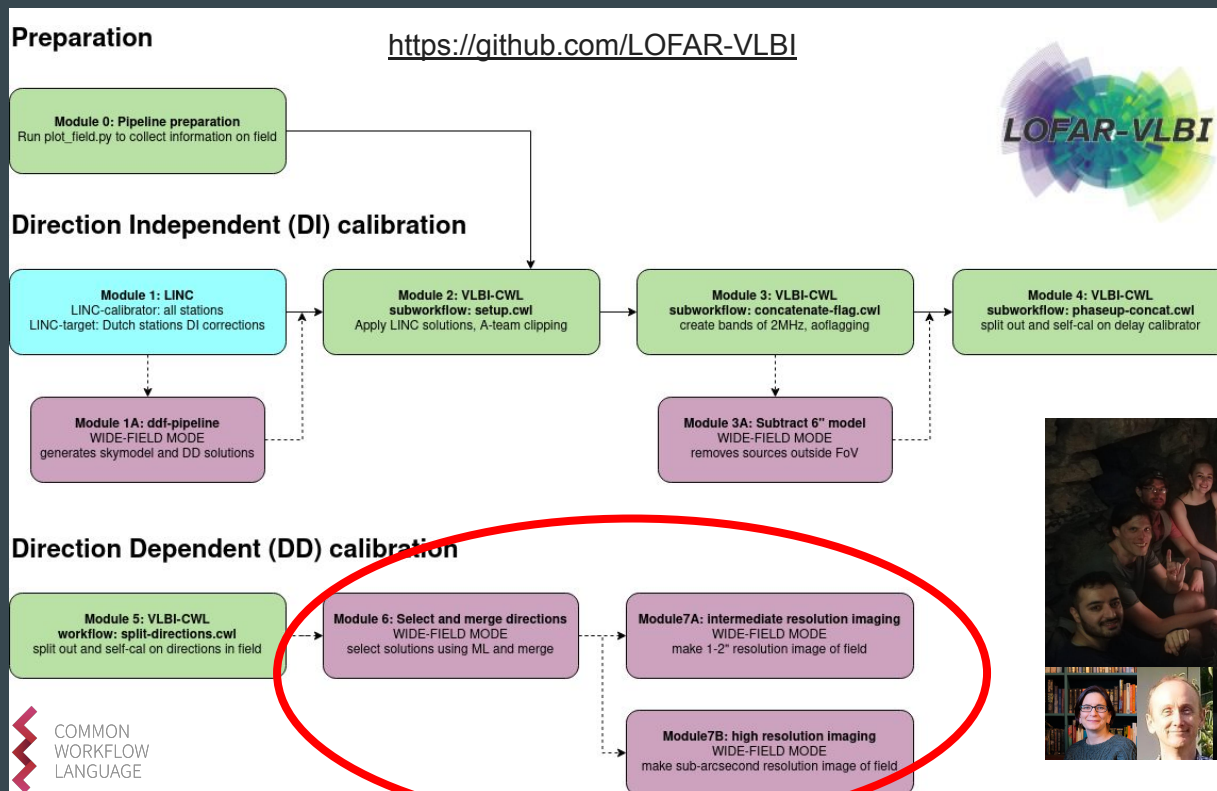

★ Large data volume: ~12 TB

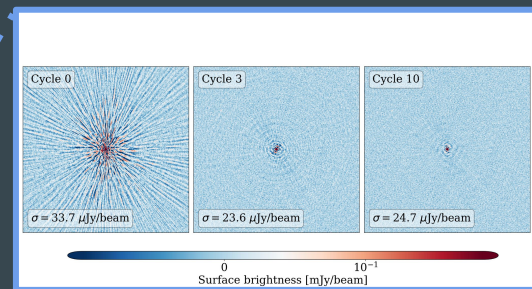

Strategy

Strategy

Facets and direction-dependent calibration

Automatic selection

Need enough signal-to-noise
at long baselines

Automatic selection

Need enough signal-to-noise
at long baselines

Solution:

Phase noise measure with
RR-LL polarisation

WHAT SHOULD WE DO NEXT?

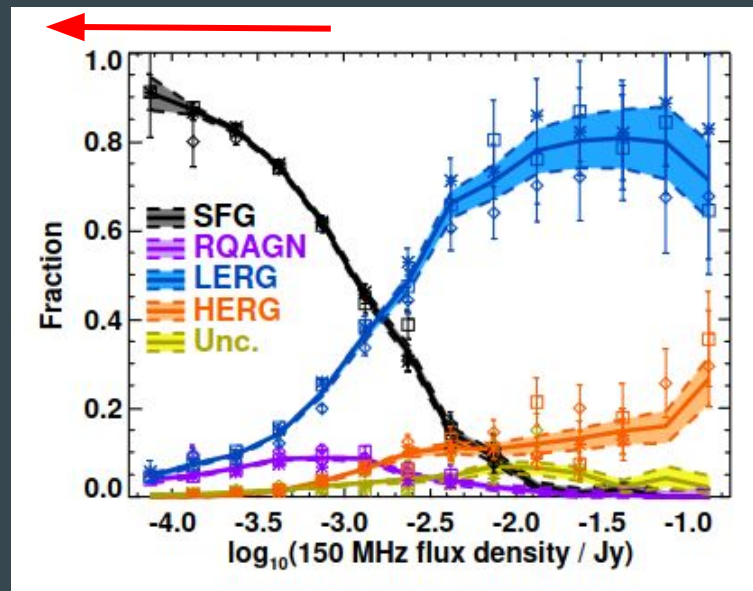

WE NEED TO GO DEEPER....

500-hrs ELAIS-N1

- ★ $6'' \rightarrow 13 \mu\text{Jy}/\text{beam}$ (Shimwell et al. in prep)
- ★ $0.3'' \rightarrow 4 \mu\text{Jy}/\text{beam}$
- ★ $\sim 150,000$ sources within 2.5×2.5 deg (compared to 2,500 with 8hr data)
- ★ Star-forming galaxies early universe
Low-surface brightness emission
Lenses? And more...

Best et al. (2023)

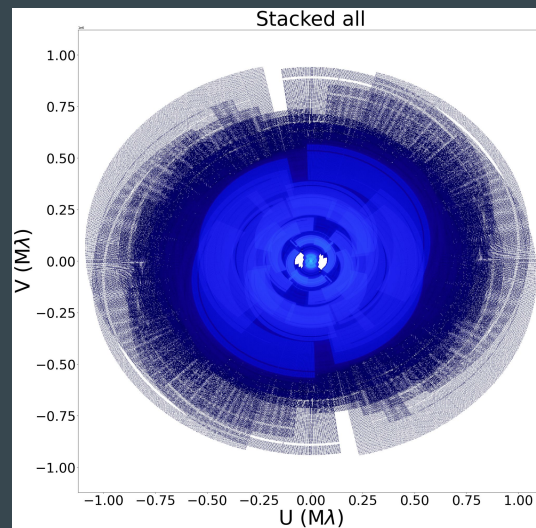

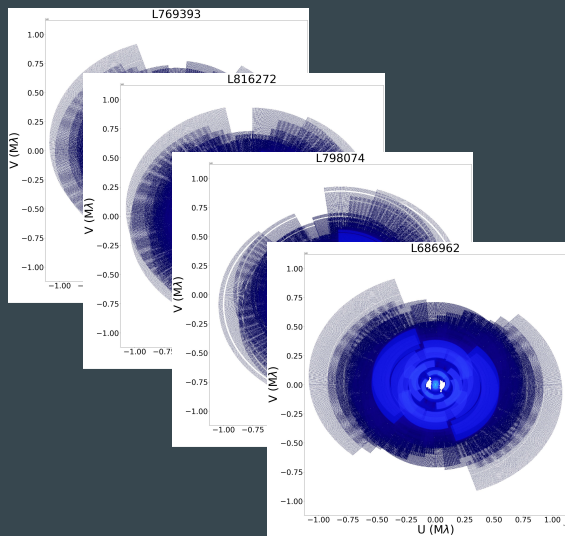

Computing costs VLBI wide-field imaging

- ★ Very expensive:
 - ~250,000 CPU hours for 8h data (Sweijen et al. 2022)
 - ~680,000 CPU hours for 32h data (de Jong et al. subm.)

- ★ Most expensive: imaging

Stacking UV plane

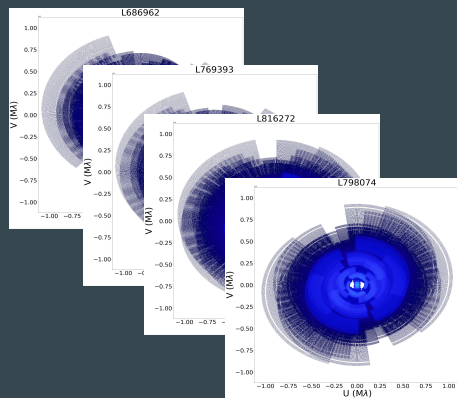

Stacking UV plane

Pros:

- ★ Reduce data volume (storage)
- ★ Faster imaging (# obs faster)
- ★ Allowing for imaging different resolutions/weightings

Cons:

- ★ Losing time axis information

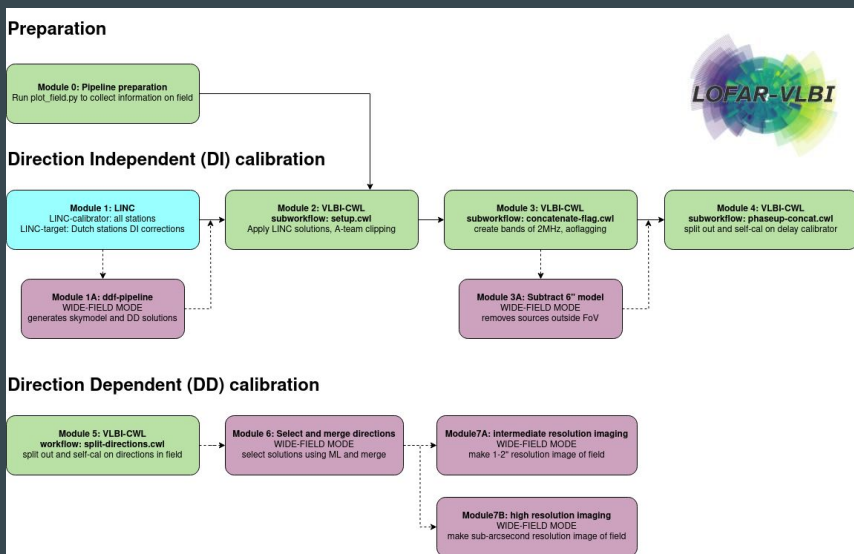

Stacked 32h

Non-stacked 32h

HPC data processing

Runner

Scheduler

Current status ELAIS-N1: 128-hrs vs. 32-hrs

Summary

- ★ Deepest 0.3" wide-field image with LOFAR at 14 $\mu\text{Jy}/\text{beam}$
- ★ First steps to automation
- ★ Paper submitted to A&A (de Jong et al. subm.)

Future prospects

- ★ Processing improvements (software, strategy)
- ★ Fully automated wide-field VLBI pipeline
- ★ Stacking \rightarrow Going to 4 $\mu\text{Jy}/\text{beam}$!

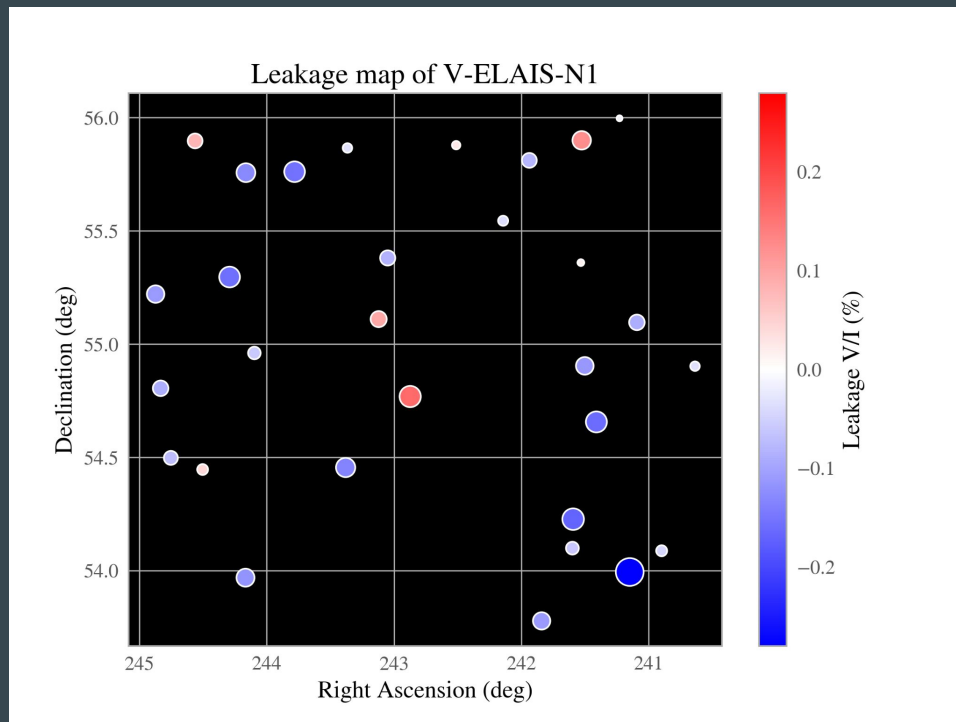

EXTRA SLIDES

ELAIS 128h vs. 32h

Total estimated speedup of a factor 4

Final inspection

In progress: ML-based parameter tuning

| Description | Example |
|---|---------|
| Bright compact source considered good enough to continue self-calibration | |
| Source considered to be too faint to calibrate on and therefore needs to stop self-calibration at cycle 0 | |
| Source considered to be 'good enough' after several rounds of self-calibration and strong calibration improvements. This source can therefore stop self-calibration: | |

FRI/FRII evolution (de Jong et al. 2024)

- ★ 6" and 144 MHz
- ★ Space density enhancements
- ★ Remaining selection biases below 40"
