**01**

**HETDEX**

# HETDEX

- **Hobby Eberly Telescope Dark Energy EXperiment**
- 10 m class optical telescope
- $R \sim 800$
- Spectroscopically studies galaxies and stars
- Joint collaboration between UT Austin, Penn State University, Ludwig-Maximilians-Universität München, and Georg-August-Universität Göttingen

**Combining the LOFAR photometric  
radio survey and the optical  
spectroscopy of HETDEX/VIRUS offers  
characterization of key physical  
parameters such as spectroscopic  
redshift, SFR, and stellar mass.**

# LoTSS targeted the HETDEX Spring field due to the synergy of their key objectives

HETDEX	LoTSS
Ability to obtain [OII] redshifts up to $z \sim 0.5$	Tracking the star formation rate density using radio continuum observations
Goal to obtain emission line redshifts using Ly $\alpha$ at $1.9 < z < 3.5$	Around the peak in the space density of powerful AGN Around the peak of the star formation rate and merger rate of galaxies

Normalized  $F_\lambda$

From the 325,694 sources in the first value-added LoTSS catalog, **28,705 sources** had fiber coverage in HETDEX DR4

# 02

## Classification and Redshift Assignment

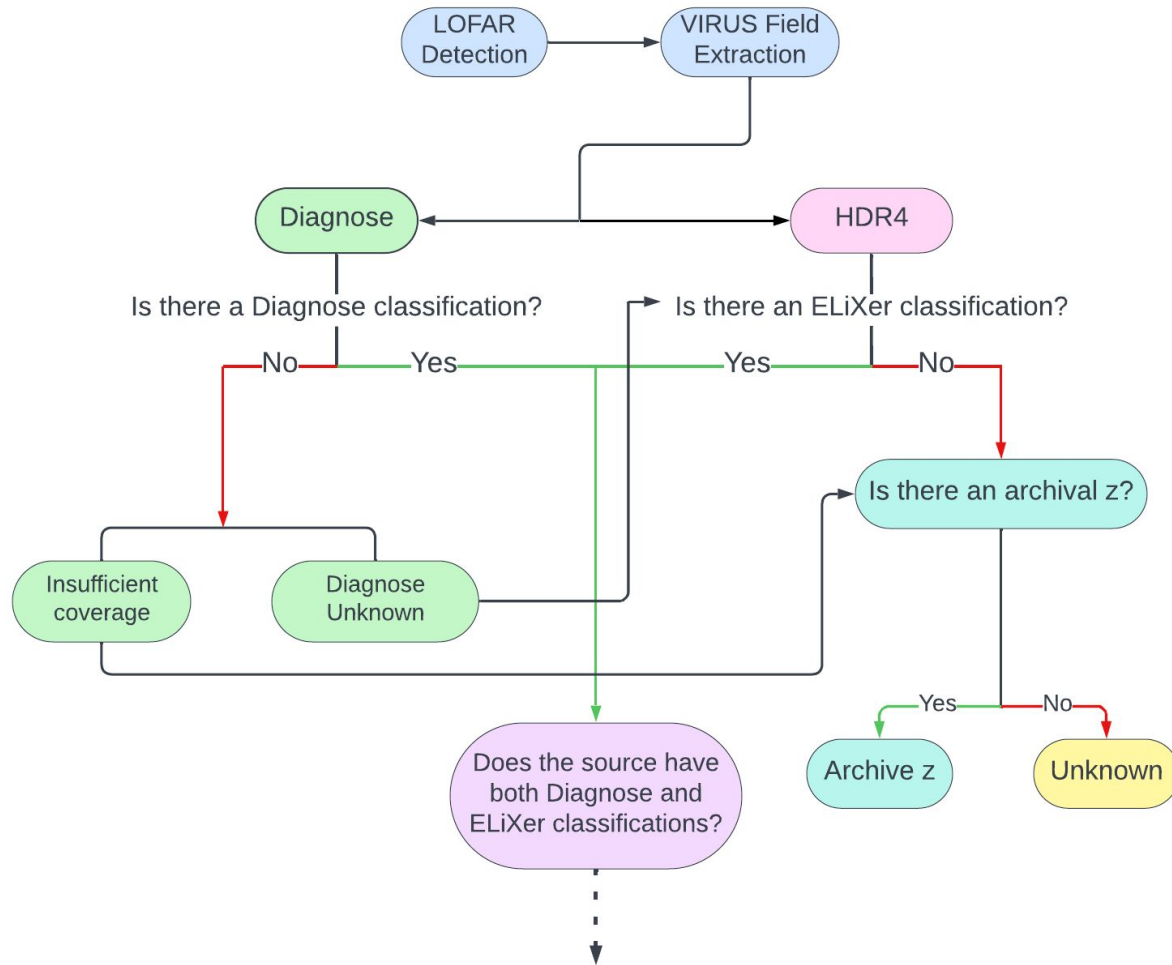

# ELiXer (Davis et al. 2023)

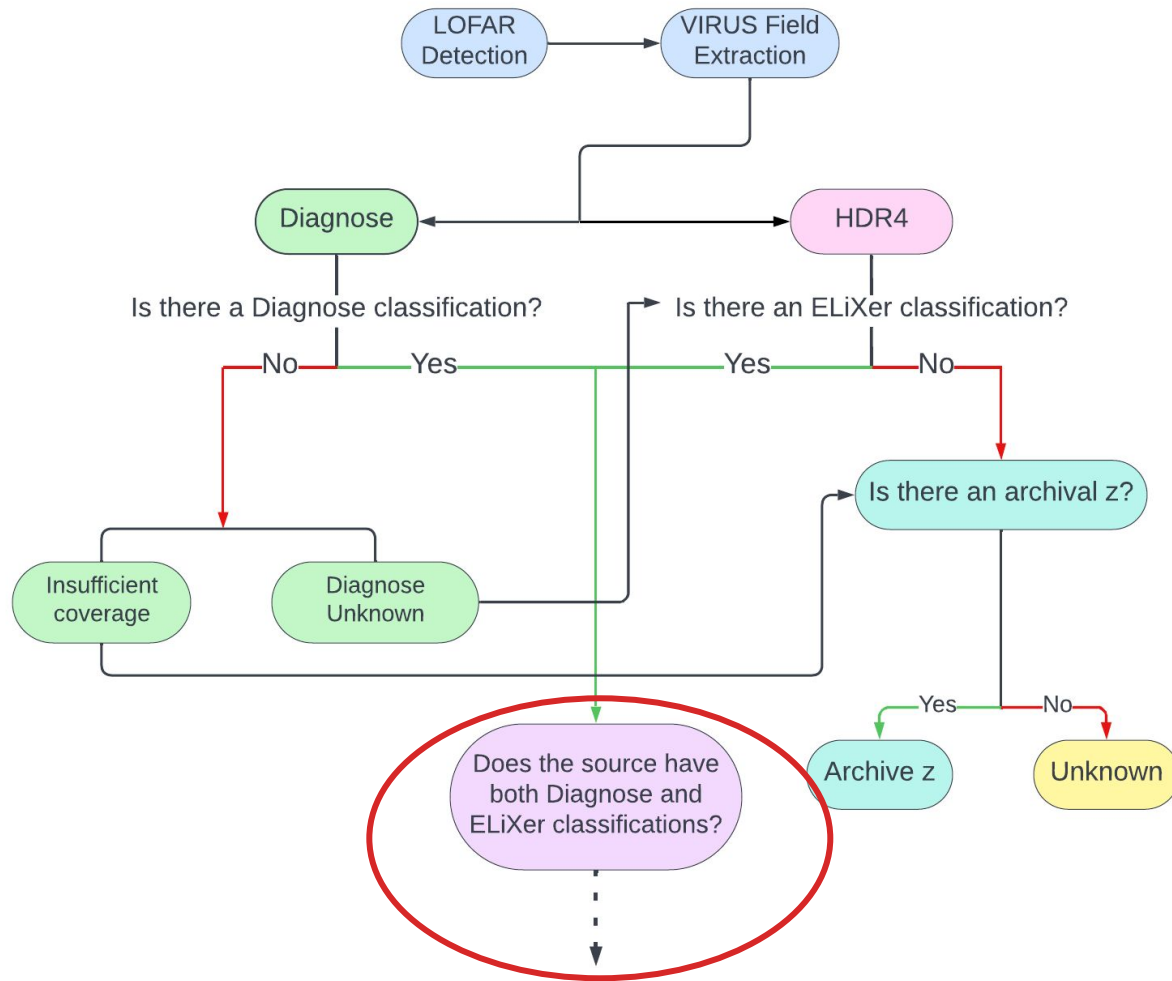

- Emission Line eXplorer
- Main classifying tool for HETDEX
- Pulls out a single emission line → identifies → derives redshift
- Specifically built to distinguish LAEs (98.1% accuracy)

# Diagnose assigns a classification of star, galaxy, or quasar and provides a redshift estimate

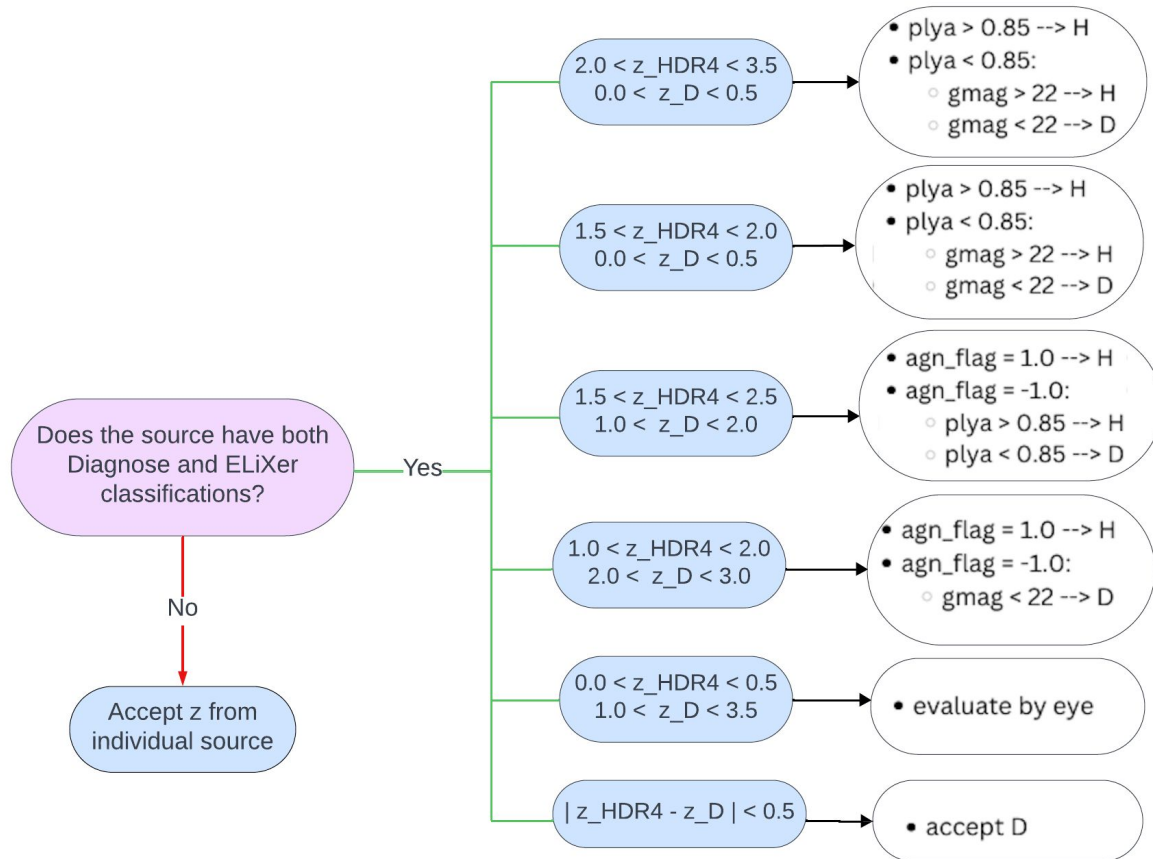

Of the 4,908  
sources with both  
Diagnose and  
HDR4 redshifts,  
**92.3%** agree within  
 $\Delta z < 0.05$

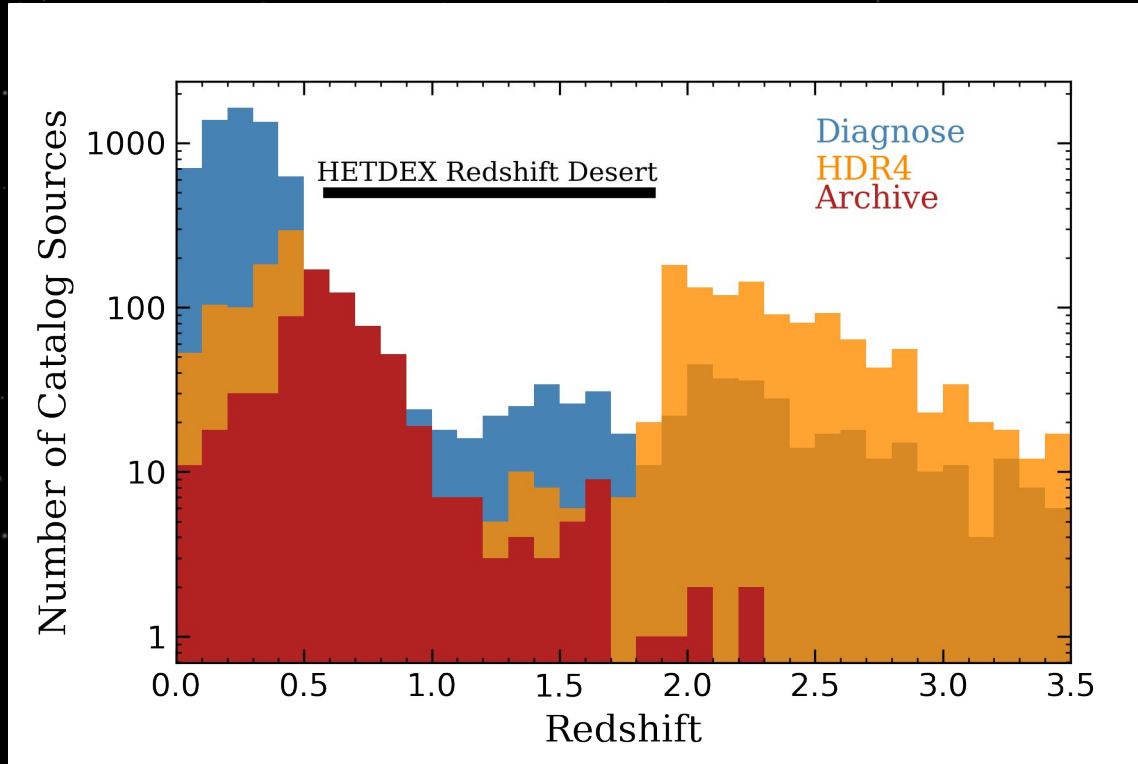

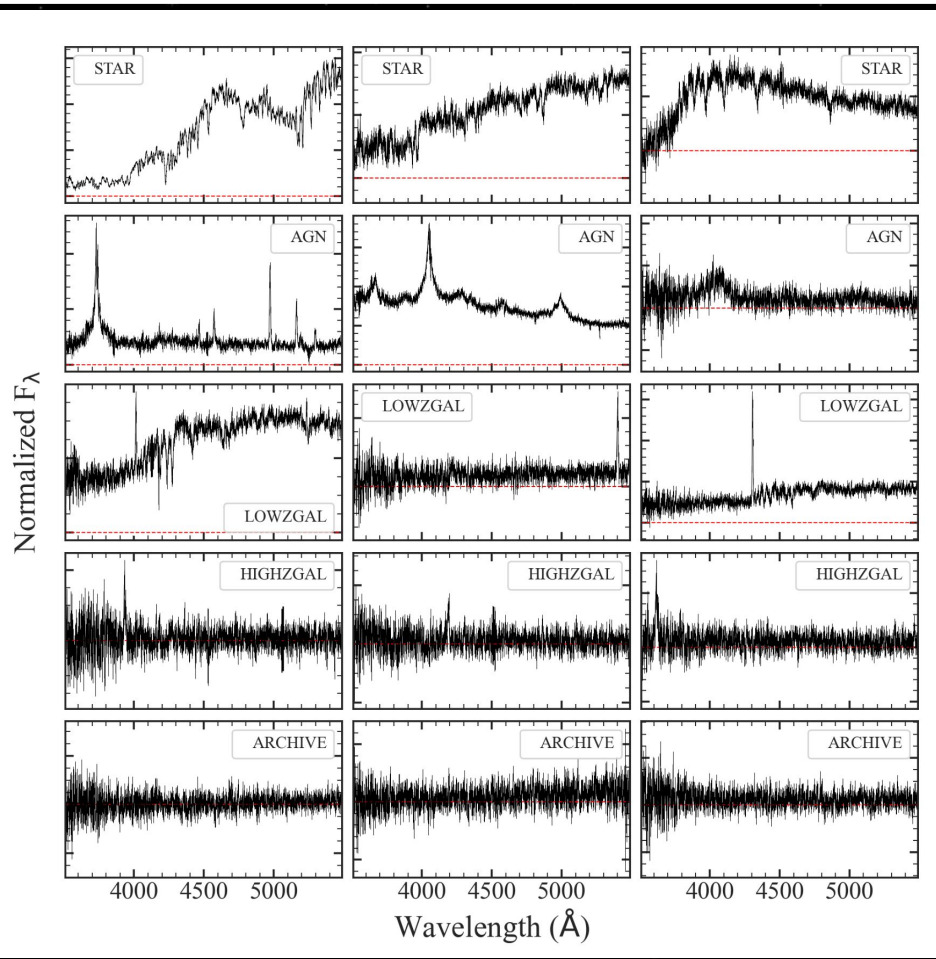

**03**

# Redshift Results

# 9,227 redshifts for 28,705 Sources

# HETDEX LOFAR Classifications

- ★ STAR - 197
- ★ AGN - 804
- ★ **LOWZGAL - 6,394**
  - $0.0 < z < 0.5$
- ★ HIGHZGAL - 1,075
  - $1.9 < z < 3.5$
- ★ ARCHIVE - 757

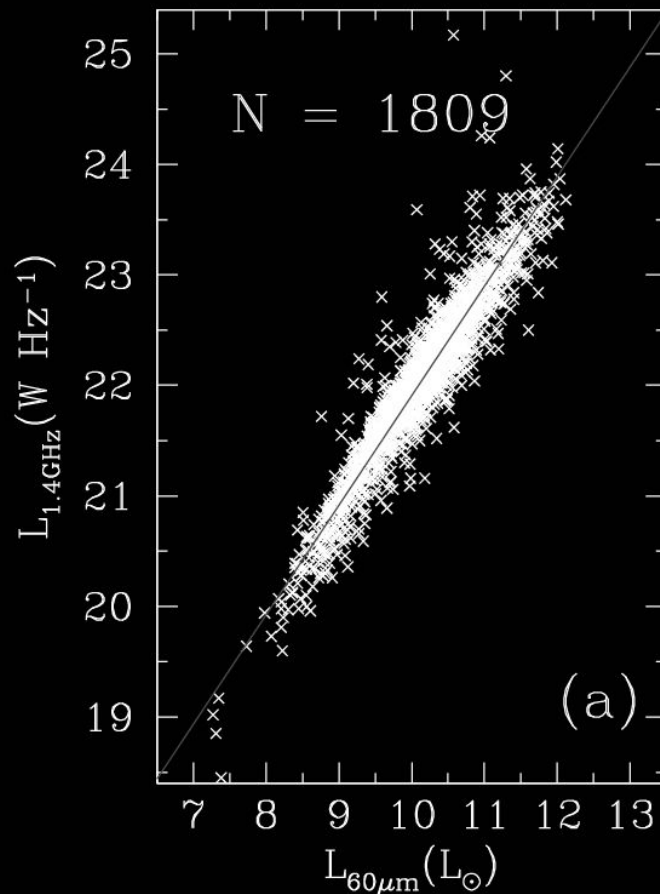

# 04

## Star Formation at Radio Wavelengths

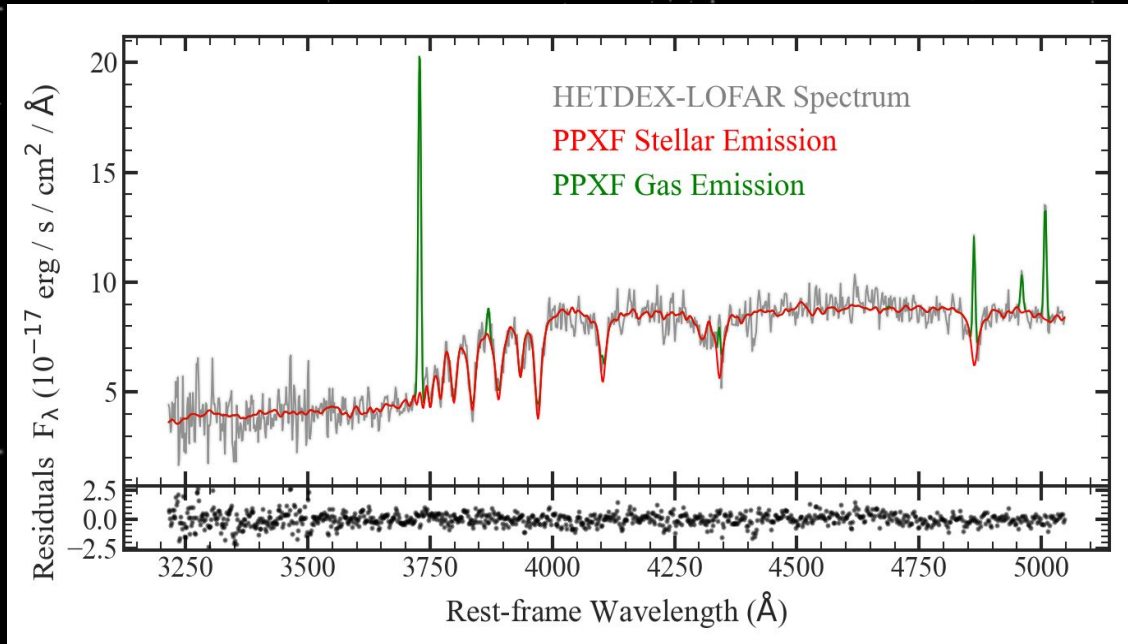

Increasing sensitivity has provided the framework for radio surveys to become the primary means of identifying star-forming galaxies

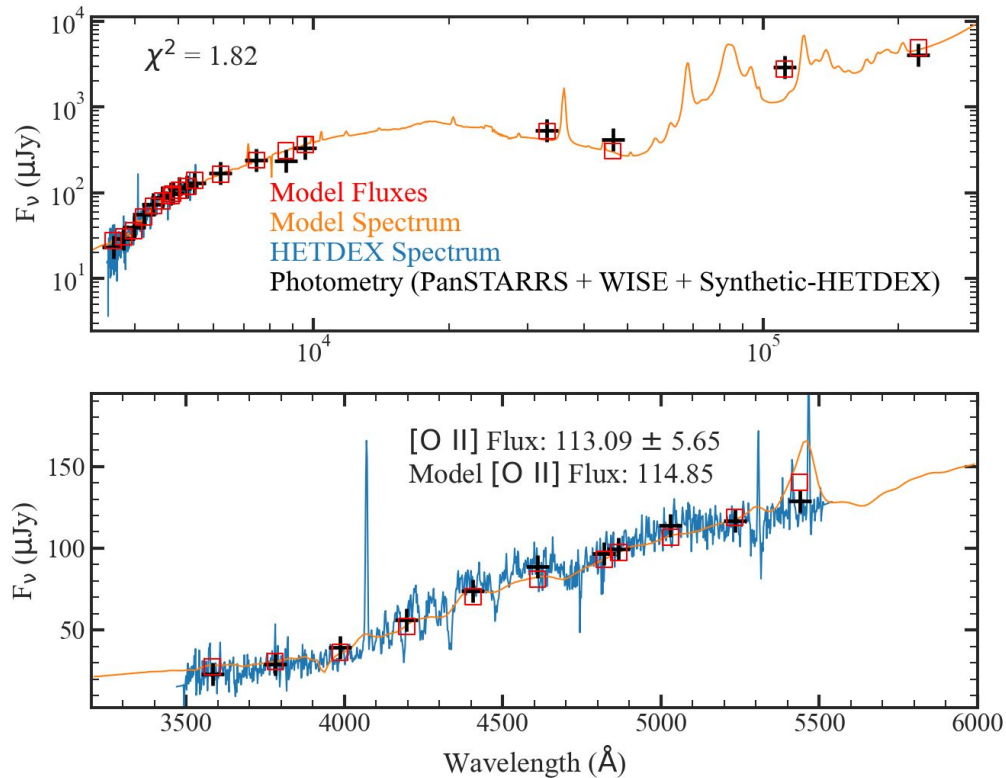

Yun et al. 2001

HETDEX LOFAR can  
explore the  
relationship between  
150 MHz with SFR/M  
and [O II] with  $\sim 5,900$   
 $z < 0.5$  galaxies

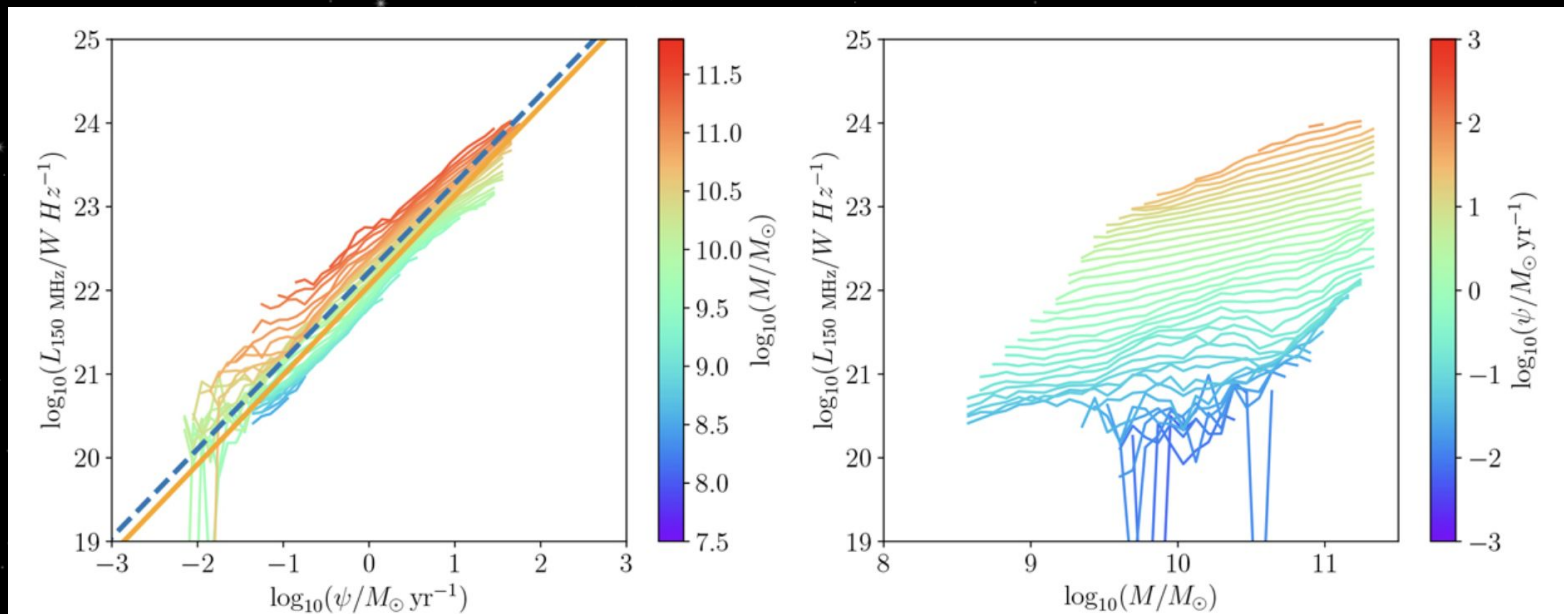

# Penalized PiXel Fitting succeeds in extracting [O II] emission but is insufficient for SED fitting

MCSED is **flexible**  
in its fitting  
approach using  
FSPS models and  
MCMC parameter  
estimation

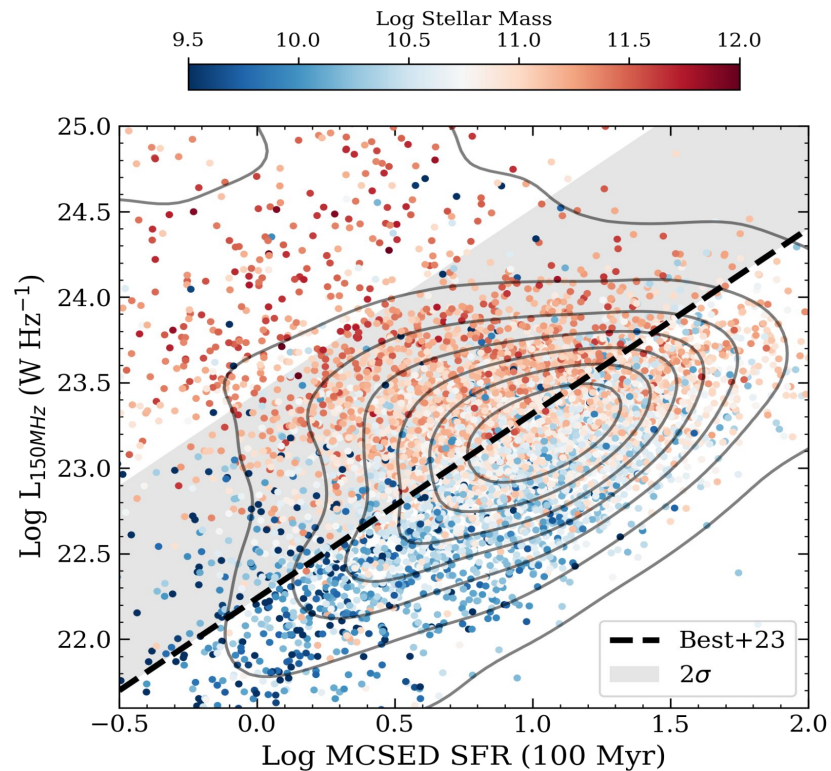

# Previous studies found strong correlation between SFR and 150 MHz but a secondary mass dependence

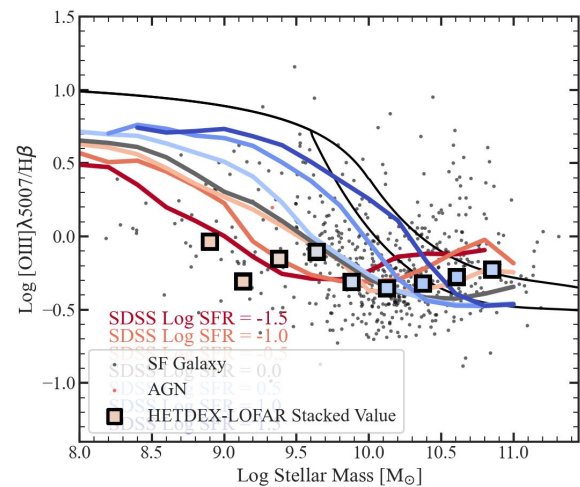

# We find a **strong correlation** between radio luminosity and SFR

# Best et al. 2023

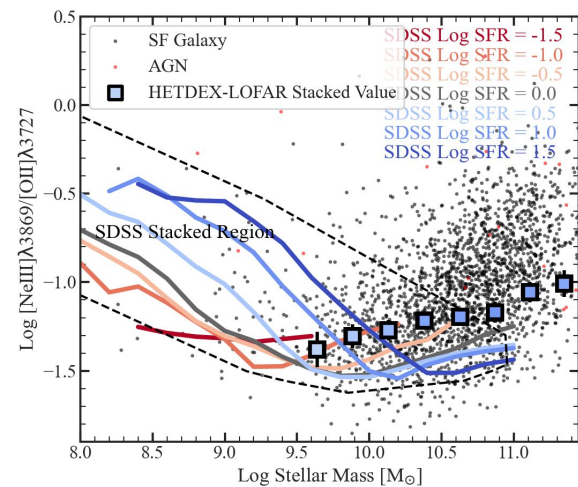

$z < 0.1$

$z < 0.1$

$z < 0.4$

- AGN have harder ionization fields
  - $\text{Ne3O2} > 1$
- No galaxies in our sample have  $\text{Ne3O2} > 1$
  
- As galaxies reach Log Stellar Mass  $> 10.5 \rightarrow$   $\text{Ne3O2}$  increases
  - Suggests possible AGN contribution

**HETDEX LOFAR  
enables many  
different  
galaxy/AGN  
projects!**

# Thank you!
